Sample Control Systems Questions for PE Exam Preparation

Below is a curated list of sample questions designed to emulate the style and complexity of the PE exam. The questions are categorized by topic for targeted preparation.

1. Control System Fundamentals and Modeling

- **Question:** A first-order control system has a transfer function given by $G(s) = \frac{K}{\tau s + 1}$. If the system's time constant (τ) is 2 seconds and the gain (K) is 4, what is the steady-state output when a unit step input is applied?

- **Answer:** The steady-state output is equal to the system gain (K) , so 4.

- **Question:** Derive the transfer function for a mass-spring-damper system with mass $(m = 5\text{ kg})$, damping coefficient $(c = 10\text{ Ns/m})$, and spring constant $(k = 200\text{ N/m})$.

- **Answer:** The transfer function from force input $(F(s))$ to displacement $(X(s))$ is $\frac{X(s)}{F(s)} = \frac{1}{ms^2 + cs + k} = \frac{1}{5s^2 + 10s + 200}$.

2. System Response and Stability

- **Question:** A control system has a characteristic equation $(s^2 + 4s + 5 = 0)$. Determine whether the system is stable, and justify your answer.

- **Answer:** The roots are $(s = -2 \pm j1)$. Since both roots have negative real parts, the system is stable.

- **Question:** For a unity feedback system with open-loop transfer function $(G(s)H(s) = \frac{K}{s(s+2)})$, find the value of (K) that causes the system to be on the verge of instability (i.e., marginal stability).

- **Answer:** Using the Routh-Hurwitz criterion, the critical value of (K) is $(K = 4)$.

3. Frequency Response and Bode Plots

- **Question:** Given $(G(s) = \frac{10}{s+1})$, what is the magnitude of the transfer function at $(\omega = 1\text{ rad/sec})$?

- **Answer:** $(|G(j\omega)| = \frac{10}{\sqrt{1^2 + 1^2}} = \frac{10}{\sqrt{2}} \approx 7.07)$.

- **Question:** Sketch the Bode magnitude plot for $G(s) = \frac{1}{(s+1)(s+10)}$. Identify the corner frequencies and approximate the magnitude at each point.

- **Answer:** Corner frequencies at 1 rad/sec and 10 rad/sec; magnitude decreases at -20 dB/decade after each corner.

4. Controller Design and Tuning

- **Question:** Design a proportional-derivative (PD) controller for a system with transfer function $G(s) = \frac{1}{s+1}$ to improve transient response. Specify the controller gains if the desired damping ratio is 0.7 and natural frequency is 2 rad/sec.

- **Answer:** Use root locus or pole placement methods to select gains; approximate gains are $K_p \approx 3.2$, $K_d \approx 1.5$ based on standard design procedures.

- **Question:** Explain the process of tuning a PID controller using the Ziegler-Nichols method for a system with a known ultimate gain K_u and ultimate period T_u .

- **Answer:** Increase the proportional gain until sustained oscillations occur; record K_u and T_u . Then set PID parameters based on empirical formulas: $K_p = 0.6 K_u$, $K_i = 2K_p/T_u$, $K_d = K_p T_u/8$.

Sample Electrical PE Exam Questions and How to Approach Them

Below are examples of typical sample questions you might encounter, along with strategies for solving them.

Sample Question 1: Power System Short Circuit Analysis

Question:

A 13.8 kV system has a bolted fault current of 25 kA at the transformer secondary. What is the fault current at the transformer primary, assuming no impedance in the transformer?

Approach:

- Convert transformer secondary voltage to primary voltage (if necessary).
- Use the transformer turns ratio to scale the fault current.
- Recognize that, with negligible impedance, fault current is proportional to the voltage ratio.

Solution:

Transformer turns ratio: $\left(\frac{13.8 \text{ kV}}{\text{Primary Voltage}} \right)$

Assuming a 13.8 kV system, primary voltage is 13.8 kV.

Fault current at primary = Fault current at secondary $\times$ (Transformer ratio)

Since the fault is at the secondary, and the impedance is negligible, the primary fault current is approximately:

$\left[\right.$

$$I_{\text{primary}} = I_{\text{fault, secondary}} \times \frac{V_{\text{primary}}}{V_{\text{secondary}}} = 25 \text{ kA} \times 1 = 25 \text{ kA}$$

$\left. \right]$

Note: In real scenarios, impedance and transformer parameters modify this calculation, but this provides a simplified estimate.

Sample Question 2: Lighting Load Calculation

Question:

A commercial building has a connected lighting load of 15 kW. Using the NEC, what is the minimum lighting load allowance for the service size calculation if the load is for general illumination?

Approach:

- Refer to NEC Table 220.12 or applicable sections.
- Apply the demand factors as per NEC guidelines.

Solution:

For general lighting, the NEC typically allows a demand factor of 100% for the first 3000 VA and 35% for the remainder.

- First 3000 VA: $3000 \text{ VA} \times 100\% = 3000 \text{ VA}$
- Remaining load: $12,000 \text{ VA} \times 35\% = 4200 \text{ VA}$

Total = $3000 \text{ VA} + 4200 \text{ VA} = 7200 \text{ VA}$ (or 7.2 kVA)

Thus, the minimum lighting load allowance is approximately 7.2 kVA.

Strategies for Using Sample Questions Effectively

Sample Electrical PE Exam Questions and Solutions

Let's analyze a few example questions to illustrate these strategies:

Example 1: Power System Short-Circuit Calculation

Question:

Given a 480 V system with a source impedance of 0.1 ohms, calculate the bolted short-circuit current at the bus.

Approach:

- Use Ohm's Law: $I = V / Z$
- Calculate: $I = 480 \text{ V} / 0.1 \text{ } = 4800 \text{ A}$

Key Takeaway:

Quick calculations like this reinforce understanding of system impedance impact on fault currents, a

common exam topic.

Example 2: Control System Steady-State Error

Question:

A unity feedback control system has a transfer function $G(s) = 10 / (s + 2)$. Find the steady-state error for a step input.

Solution:

- For a type 0 system with unity feedback, steady-state error (e_{ss}) = $1 / (1 + K)$, where $K = \lim_{s \rightarrow 0} G(s)$
- $K = 10 / (0 + 2) = 5$
- $e_{ss} = 1 / (1 + 5) = 1/6 \approx 0.167$

Insight:

Practicing such problems solidifies concepts of system type and error analysis.
